

Table of Contents

Introduction	xi
Glossary	xv
1 Statistical Description of Large Systems. Postulates	1
1.1 Classical or Quantum Evolution of a Particle ; Phase Space . . .	2
1.1.1 Classical Evolution	2
1.1.2 Quantum Evolution	4
1.1.3 Uncertainty Principle and Phase Space	4
1.1.4 Other Degrees of Freedom	5
1.2 Classical Probability Density ; Quantum Density Operator . . .	5
1.2.1 Statistical Approach for Macroscopic Systems	6
1.2.2 Classical Probability Density	8
1.2.3 Density Operator in Quantum Mechanics	9
1.3 Statistical Postulates ; Equiprobability	10
1.3.1 Microstate, Macrostate	10
1.3.2 Time Average and Ensemble Average	11
1.3.3 Equiprobability	12
1.4 General Properties of the Statistical Entropy	15
1.4.1 The Boltzmann Definition	15
1.4.2 The Gibbs Definition	15
1.4.3 The Shannon Definition of Information	18
Summary of Chapter 1	19
Appendix 1.1	21
Appendix 1.2	27
Appendix 1.3	29
2 The Different Statistical Ensembles. General Methods	31
2.1 Energy States of an N -Particle System	32
2.2 Isolated System in Equilibrium : “Microcanonical Ensemble” .	35
2.3 Equilibrium Conditions for Two Systems in Contact	36
2.3.1 Equilibrium Condition : Equal β Parameters	36
2.3.2 Fluctuations of the Energy Around its Most Likely Value	37

2.4	Contact with a Heat Reservoir, “Canonical Ensemble”	40
2.4.1	The Boltzmann Factor	41
2.4.2	Energy, with Fixed Average Value	42
2.4.3	Partition Function Z	44
2.4.4	Entropy in the Canonical Ensemble	45
2.4.5	Partition Function of a Set of Two Independent Systems	46
2.5	Grand Canonical Ensemble	48
2.5.1	Equilibrium Condition : Equality of Both T 's and μ 's	49
2.5.2	Heat Reservoir and Particles Reservoir	50
2.5.3	Grand Canonical Probability and Partition Function	51
2.5.4	Average Values	52
2.5.5	Grand Canonical Entropy	53
2.6	Other Statistical Ensembles	53
	Summary of Chapter 2	55
	Appendix 2.1	57
3	Thermodynamics and Statistical Physics	59
3.1	Zeroth Law of Thermodynamics	60
3.2	First Law of Thermodynamics	60
3.2.1	Work	61
3.2.2	Heat	63
3.2.3	Quasi-Static General Process	63
3.3	Second Law of Thermodynamics	64
3.4	Third Law of Thermodynamics	66
3.5	The Thermodynamical Potentials; the Legendre Transformation	67
3.5.1	Isolated System	67
3.5.2	Fixed N , Contact with a Heat Reservoir at T	69
3.5.3	Contact with a Heat and Particle Reservoir at T	70
3.5.4	Transformation of Legendre; Other Potentials	72
	Summary of Chapter 3	75
4	The Ideal Gas	79
4.1	Introduction	79
4.2	Kinetic Approach	80
4.2.1	Scattering Cross Section, Mean Free Path	80
4.2.2	Kinetic Calculation of the Pressure	81
4.3	Classical or Quantum Statistics?	83
4.4	Classical Statistics Treatment of the Ideal Gas	85
4.4.1	Calculation of the Canonical Partition Function	85
4.4.2	Average Energy; Equipartition Theorem	87
4.4.3	Free Energy; Physical Parameters (P, S, μ)	89
4.4.4	Gibbs Paradox	90
4.5	Conclusion	91
	Summary of Chapter 4	93
	Appendix 4.1	95

Appendix 4.2	103
5 Indistinguishability, the Pauli Principle	113
5.1 Introduction	114
5.2 States of Two Indistinguishable Particles	116
5.2.1 General Case	116
5.2.2 Independent Particles	116
5.3 Pauli Principle; Spin-Statistics Connection	119
5.3.1 Pauli Principle; Pauli Exclusion Principle	119
5.3.2 Theorem of Spin-Statistics Connection	120
5.4 Case of Two Particles of Spin 1/2	121
5.4.1 Triplet and Singlet Spin States	121
5.4.2 Wave Function of Two Spin 1/2 Particles	123
5.5 Special Case of N Independent Particles	124
5.5.1 Wave Function	124
5.5.2 Occupation Numbers	125
5.6 Return to the Introduction Examples	126
5.6.1 Fermions Properties	126
5.6.2 Bosons Properties	126
Summary of Chapter 5	129
6 General Properties of the Quantum Statistics	131
6.1 Use of the Grand Canonical Ensemble	132
6.1.1 2 Indistinguishable Particles at T , Canonical Ensemble	132
6.1.2 Description in the Grand Canonical Ensemble	133
6.2 Factorization of the Grand Partition Function	134
6.2.1 Fermions and Bosons	134
6.2.2 Fermions	135
6.2.3 Bosons	135
6.2.4 Chemical Potential and Number of Particles	136
6.3 Average Occupation Number; Grand Potential	136
6.4 Free Particle in a Box; Density of States	138
6.4.1 Quantum States of a Free Particle in a Box	138
6.4.2 Density of States	143
6.5 Fermi-Dirac Distribution; Bose-Einstein Distribution	147
6.6 Average Values of Physical Parameters at T	148
6.7 Common Limit of the Quantum Statistics	149
6.7.1 Chemical Potential of the Ideal Gas	149
6.7.2 Grand Canonical Partition Function of the Ideal Gas	151
Summary of Chapter 6	153
7 Free Fermions Properties	155
7.1 Properties of Fermions at Zero Temperature	155
7.1.1 Fermi Distribution, Fermi Energy	155
7.1.2 Internal Energy and Pressure at Zero Temperature	158

7.1.3	Magnetic Properties. Pauli Paramagnetism	159
7.2	Properties of Fermions at Non-Zero Temperature	160
7.2.1	Temperature Ranges and Chemical Potential Variation .	160
7.2.2	Specific Heat of Fermions	163
7.2.3	Thermionic Emission	165
	Summary of Chapter 7	169
	Appendix 7.1	171
8	Elements of Bands Theory and Crystal Conductivity	175
8.1	What is a Solid, a Crystal?	176
8.2	The Eigenstates for the Chosen Model	177
8.2.1	Recall : the Double Potential Well	177
8.2.2	Electron on an Infinite and Periodic Chain	180
8.2.3	Energy Bands and Bloch Functions	182
8.3	The Electron States in a Crystal	184
8.3.1	Wave Packet of Bloch Waves	184
8.3.2	Resistance; Mean Free Path	184
8.3.3	Finite Chain, Density of States, Effective Mass	185
8.4	Statistical Physics of Solids	189
8.4.1	Filling of the Levels	189
8.4.2	Variation of Metal Resistance versus T	190
8.4.3	Insulators' Conductivity Versus T ; Semiconductors	191
8.5	Examples of Semiconductor Devices	196
8.5.1	The Photocopier : Photoconductivity Properties	196
8.5.2	The Solar Cell : an Illuminated $p - n$ Junction	196
8.5.3	CD Readers : the Semiconductor Quantum Wells	197
	Summary of Chapter 8	199
9	Bosons : Helium 4, Photons, Thermal Radiation	201
9.1	Material Particles	201
9.1.1	Thermodynamics of the Boson Gas	202
9.1.2	Bose-Einstein Condensation	203
9.2	Bose-Einstein Distribution of Photons	206
9.2.1	Description of the Thermal Radiation; the Photons	206
9.2.2	Statistics of Photons, Bosons in Non-Conserved Number	207
9.2.3	Black Body Definition and Spectrum	210
9.2.4	Microscopic Interpretation	212
9.2.5	Photometric Measurements : Definitions	214
9.2.6	Radiative Balances	217
9.2.7	Greenhouse Effect	218
	Summary of Chapter 9	221
	Solving Exercises and Problems of Statistical Physics	223
	Units and Physical Constants	225

A few useful formulae	229
Exercises and Problems	231
Ex. 2000 : Electrostatic Screening	233
Ex. 2001 : Magnetic Susceptibility of a “Quasi-1D” Conductor . . .	234
Ex. 2002 : Entropies of the HCl Molecule	236
Pr. 2001 : Quantum Boxes and Optoelectronics	237
Pr. 2002 : Physical Foundations of Spintronics	245
Solution of the Exercises and Problems	251
Ex. 2000 : Electrostatic Screening	253
Ex. 2001 : Magnetic Susceptibility of a “Quasi-1D” Conductor . . .	255
Ex. 2002 : Entropies of the HCl Molecule	258
Pr. 2001 : Quantum Boxes and Optoelectronics	259
Pr. 2002 : Physical Foundations of Spintronics	266
Index	275
