1	The Science of fMRI	1
1.1	A Quick Tour of the Brain	1
1.2	The Science of fMRI	3
1.2.1	Introduction to Magnetic Resonance	4
1.2.2	Acquiring MR Images	6
1.2.3	Relaxation	8
1.2.4	From MRI to fMRI	12
1.2.5	From Data to Image	14
2	Design of fMRI Experiments	17
2.1	Imaging Design Issues	17
2.1.1	Description of Parameters	17
2.1.2	How Are Resolution and Image Quality Affected by Changes in the Parameters?	20
2.1.3	Filling in k-Space	23
2.2	Statistical Design Issues	26
2.2.1	Common Experimental Designs	26
2.2.2	Additional Issues	32
3	Noise and Data Preprocessing	37
3.1	Sources of Noise	37
3.2	Dealing with Noise by Manipulating the Scanning Environment	41
3.3	Preprocessing fMRI Data	43
3.4	Assessing the Effects of Preprocessing	50
4	Statistical Issues in fMRI Data Analysis	53
4.1	Characteristics of the Data	53
4.2	Detection or Estimation?	55
4.3	Thresholding	56
4.3.1	Is “Voxel Activation” the Right Criterion?	56
4.3.2	Reliability and Reproducibility of Activation	57

4.4	Multiple Subjects	59
4.4.1	Consistency Across Subjects	59
4.5	Regional Versus Whole Brain Analysis	61
4.6	Summary of Statistical Challenges	63
5	Basic Statistical Analysis	65
5.1	Exploratory Data Analysis	65
5.2	Block Designs: Basic Analysis	66
5.3	Event-Related Designs: Basic Analysis	71
5.3.1	Parametric Approaches to the Estimation of the HRF	72
5.3.2	Nonparametric Approaches to the Estimation of the HRF	75
5.3.3	Methods for Estimating the Delay of the Hemodynamic Response	79
5.4	The General Linear Model	82
5.4.1	Some Implementation Issues	85
5.5	Methods for Combining Subjects	88
5.5.1	The Anatomical Question	88
5.5.2	The Statistical Question	92
6	Temporal, Spatial, and Spatiotemporal Models	101
6.1	Temporal Models	101
6.1.1	Time Domain Analysis	102
6.1.2	Frequency Domain Analysis	105
6.1.3	Effect of Ignoring Temporal Correlation	109
6.2	Spatial Models	110
6.2.1	Bayesian Spatial Models	111
6.2.2	Clustering for Spatial Modeling	114
6.3	Spatiotemporal Models	115
6.3.1	Clustering fMRI Time Series	116
6.3.2	Direct Modeling	125
6.4	Software Issues	132
7	Multivariate Approaches	133
7.1	Description of Methods	134
7.1.1	Principal Components Analysis	134
7.1.2	Independent Components Analysis	135
7.1.3	Canonical Correlation Analysis	137
7.2	Multivariate Analyses	137
7.2.1	Principal Components	138
7.2.2	Independent Components	143
7.2.3	Canonical Correlation	153
7.3	Software Issues	156

8	Basis Function Approaches	157
8.1	Wavelets	157
8.1.1	Creating Activation Maps with Wavelets	159
8.1.2	Wavelets for Modeling	161
8.1.3	Wavelet Resampling	162
8.1.4	Assessing Wavelet Methods	164
8.2	Basis Functions Informed by Anatomy and Physiology	166
8.3	Summary	170
9	Bayesian Methods in fMRI	173
9.1	Fully Bayes Models	175
9.2	Priors for fMRI Data	180
9.3	Computation	182
9.4	Conclusion	185
10	Multiple Testing in fMRI: The Problem of “Thresholding”	187
10.1	Cluster Thresholds	189
10.2	Random Field Theory	191
10.3	Thresholds Obtained via Permutation	193
10.4	Control of the False Discovery Rate	195
10.5	An Ad Hoc Method	197
10.6	Procedures Based on fMRI Time Series and the HRF	198
10.7	Other Techniques	200
10.8	Evaluation of Methods	202
10.9	Other Issues	205
10.10	Conclusion	210
11	Additional Statistical Issues	211
11.1	Whitening Versus Smoothing	211
11.2	Functional and Effective Connectivity	213
11.2.1	The Use of Correlation to Assess Connectivity	214
11.2.2	Structural Equation Models	219
11.2.3	Other Approaches	221
11.2.4	Conclusion	222
11.3	Model Selection	222
11.4	Evaluation of Competing Methods	224
11.5	Summary	228
12	Case Study: Eye Motion Data	231
12.1	Description of the Data	231
12.2	Data Analysis	232
12.3	Summary	243
