Contents

1 Introduction 1
1.1 The Purpose of this Book 1
1.2 Theory and Practice 2
1.3 Conceptual Approach 5
1.4 The Structure of this Book 7
References 8

2 Systems Concepts 9
2.1 System 9
2.2 Subsystems and Aspectsystems 13
2.2.1 Subsystem 14
2.2.2 Aspectsystem 14
2.3 State, Process and Behaviour 17
2.3.1 State 17
2.3.2 Process 19
2.3.3 Behaviour 20
2.4 Goal, Function and Task 21
2.5 System and Environment 25
2.5.1 The System Boundary 25
2.6 Some Other Definitions 27
References 28

3 Case: The Flight Department 29
3.1 Case History 29
3.2 Problem Description 30
3.3 Problem Analysis 31
3.4 Complications Due to Bad Weather 38
3.5 Radar Complications 44

3.6 Dispersion of Variables and the Required Number of Radar Test Cars 48
3.7 Results in Practice 55
References 57

4 Models for the Structuring of Processes 59
4.1 Process Types 59
4.2 Determination of Subsystems 60
4.3 System Control 62
4.3.1 Function Control 62
4.3.2 Process Control 65
4.3.3 Boundary Zone on the Input Side 71
4.3.4 Boundary Zone on the Output Side 73
4.4 Supporting Processes 75
4.5 The Steady-state Model: Combining the Models into One Model 77
4.6 Testing a Works Process Planning Department Against Reality 81
4.7 Nurses Effect 82
4.8 Case: The Health Insurance Company 86
4.9 Some Applications in Practice 90
References 92

5 Conceptual Model for the Analysis of Industrial Systems 95
5.1 Introduction 95
5.2 Other Conceptual Models 96
5.2.1 Formal System Model 96
5.2.2 The Viable System Model 97
5.3 Common Characteristics of the Conceptual Models 98
5.4 The "PROPER" Model of Industrial Systems 101
5.5 The "PROPER" Model and Logistic Practice 103
References 106

6 Behaviour of a Function: The Process 107
6.1 Introduction 107
6.2 Behaviour 108
6.3 The State and Input of an Industrial Function 109
6.4 The Behaviour of an Industrial System 111
6.5 Basic Concepts of Process Descriptions 119
6.5.1 Properties 119
6.5.2 Characteristics of "Periods" 123
6.5.3 Aggregation 128
6.6 Case: Simulation of the Flight Department 131
6.7 Conclusions 133
References 134

7 The Case of the Ship Engine Factory 135
7.1 The Models as a Diagnostic Aid 135
7.2 Description of the Existing Situation 136
7.3 Solution: Analysis Based Upon the PROPER Model 139
7.4 Solution: Analysis Based Upon the Steady-state Model 141

8 Policy and Performance 147
8.1 What is Policy? 147
8.2 Does an Industrial System Need Policy? 151
8.3 Considerations When Choosing the Ways and Means 153
8.4 The Concepts of Productivity, Efficiency and Performance 157
8.5 Application of the Concepts 163
References 168

9 Model for the Innovation Process 169
9.1 Setting Up the Model for the Innovation Process 169
9.1.1 Environmental Reconnaissance and Definition of Goals 169
9.1.2 Policy-Making 171
9.1.3 Confrontation and Tuning 172
9.1.4 Development and (Re-)Equipping 173
9.1.5 Control of the Innovation Process 174
9.1.6 Policy Evaluation 175
9.1.7 Innovation and Improvement of Existing Processes 176
9.2 The Nature of the Model for Innovation Processes 176
9.3 Policy Evaluation 177
References 179

10 The Design Process with the Conceptual Models 181
10.1 Introduction 181
10.2 The Design Process 182
10.3 Function Design 185
10.4 Process Design 189
10.4.1 Introduction 189
10.4.2 The Design of Technical Systems 190
10.4.3 The Design of Organisation Systems 192
10.4.4 The Design of Information Systems 194
10.5 Simulation as a Supporting Tool for the Design of Industrial Systems 195
References 195

11 Case: The Automated Container Terminal 197
11.1 Introduction 197
11.2 The Project Program 198
11.3 Functional Requirements 201

11.4 Application of the PROPER Model 203
11.4.1 The Terminal Level 203
11.4.2 The Order Flow 207
11.4.3 The Product Flow 208
11.4.4 The Resource Flow 210
11.5 Behaviour Descriptions for Productivity Definitions 211
11.5.1 Goals of the Behaviour Descriptions 211
10.5.2 Experiments 214
11.5.3 Results 217
11.5.4 Using the Behaviour Model During the Project 218
11.6 Conclusions 219
References 220
