Contents

Part I Introduction

1 Introduction . . . 3
1.1 Characteristics of Turbulence . . . 6
1.2 What are Useful Averages? . . . 8
1.3 Conventional Turbulence Models . . . 14
1.4 Large Eddy Simulation . . . 16
1.5 Problems with Boundaries . . . 17
1.6 The Interior Closure Problem in LES . . . 18
1.7 Eddy Viscosity Closure Models in LES . . . 20
1.8 Closure Models Based on Systematic Approximation . . . 22
1.9 Mixed Models . . . 25
1.10 Numerical Validation and Testing in LES . . . 26

2 The Navier–Stokes Equations . . . 29
2.1 An Introduction to the NSE . . . 29
2.2 Derivation of the NSE . . . 32
2.3 Boundary Conditions . . . 36
2.4 A Few Results on the Mathematics of the NSE . . . 37
2.4.1 Notation and Function Spaces . . . 38
2.4.2 Weak Solutions in the Sense of Leray–Hopf . . . 42
2.4.3 The Energy Balance . . . 43
2.4.4 Existence of Weak Solutions . . . 47
2.4.5 More Regular Solutions . . . 54
2.5 Some Remarks on the Euler Equations . . . 62
2.6 The Stochastic Navier–Stokes Equations . . . 65
2.7 Conclusions . . . 68

Part II Eddy Viscosity Models

3 Introduction to Eddy Viscosity Models 71
3.1 Introduction 71
3.2 Eddy Viscosity Models 72
3.3 Variations on the Smagorinsky Model 77
3.3.1 Van Driest Damping 78
3.3.2 Alternate Scalings 78
3.3.3 Models Acting Only on the Smallest Resolved Scales .. 80
3.3.4 Germano's Dynamic Model 80
3.4 Mathematical Properties of the Smagorinsky Model 81
3.4.1 Further Properties of Monotone Operators 93
3.5 Backscatter and the Eddy Viscosity Models 102
3.6 Conclusions 103

4 Improved Eddy Viscosity Models 105
4.1 Introduction 105
4.2 The Gaussian–Laplacian Model (GL) 111
4.2.1 Mathematical Properties 112
4.3 $k - \varepsilon$ Modeling 117
4.3.1 Selective Models 118
4.4 Conclusions 121

5 Uncertainties in Eddy Viscosity Models and Improved Estimates of Turbulent Flow Functionals 123
5.1 Introduction 123
5.2 The Sensitivity Equations of Eddy Viscosity Models 124
5.2.1 Calculating $\overline{\mathbf{f}}_\delta = \frac{\partial}{\partial \delta}\overline{\mathbf{f}}$ 126
5.2.2 Boundary Conditions for the Sensitivities 127
5.3 Improving Estimates of Functionals of Turbulent Quantities .. 127
5.4 Conclusions: Are $\overline{\mathbf{u}}$ and $\overline{p}$ Enough? 130

Part III Advanced Models

6 Basic Criteria for Subfilter-scale Modeling 135
6.1 Modeling the Subfilter-scale Stresses 135
6.2 Requirements for a Satisfactory Closure Model 136

7 Closure Based on Wavenumber Asymptotics 143
7.1 The Gradient (Taylor) LES Model 145
7.1.1 Derivation of the Gradient LES Model 145
7.1.2 Mathematical Analysis of the Gradient LES Model . . . 147
7.1.3 Numerical Validation and Testing 153
7.2 The Rational LES Model (RLES) 154
7.2.1 Mathematical Analysis for the Rational LES Model . . . 157
7.2.2 On the Breakdown of Strong Solutions 170
7.2.3 Numerical Validation and Testing 177
7.3 The Higher-order Subfilter-scale Model (HOSFS) 179
7.3.1 Derivation of the HOSFS Model 179
7.3.2 Mathematical Analysis of the HOSFS Model 181
7.3.3 Numerical Validation and Testing 188
7.4 Conclusions 193

8 Scale Similarity Models 195
8.1 Introduction 195
8.1.1 The Bardina Model 195
8.2 Other Scale Similarity Models 200
8.2.1 Germano Dynamic Model 200
8.2.2 The Filtered Bardina Model 200
8.2.3 The Mixed-scale Similarity Model 201
8.3 Recent Ideas in Scale Similarity Models 201
8.4 The S^4 = Skew-symmetric Scale Similarity Model 205
8.4.1 Analysis of the Model 206
8.4.2 Limit Consistency and Verifiability of the S^4 Model . . 208
8.5 The First Energy-sponge Scale Similarity Model 213
8.5.1 "More Accurate" Models 217
8.6 The Higher Order, Stolz–Adams Deconvolution Models 219
8.6.1 The van Cittert Approximations 220
8.7 Conclusions 223

Part IV Boundary Conditions

9 Filtering on Bounded Domains 227
9.1 Filters with Nonconstant Radius 229
9.1.1 Definition of the Filtering 230
9.1.2 Some Estimates of the Commutation Error 234
9.2 Filters with Constant Radius 240
9.2.1 Derivation of the Boundary Commutation Error (BCE) 241
9.2.2 Estimates of the BCE 246
9.2.3 Error Estimates for a Weak Form of the BCE 249
9.2.4 Numerical Approximation of the BCE 250
9.3 Conclusions 251

10 Near Wall Models in LES 253
10.1 Introduction 253
10.2 Wall Laws in Conventional Turbulence Modeling 254
10.3 Current Ideas in Near Wall Modeling for LES 256
10.4 New Perspectives in Near Wall Models 259
10.4.1 The 1/7th Power Law in 3D 261
10.4.2 The $1/n$th Power Law in 3D 266
10.4.3 A Near Wall Model for Recirculating Flows 268
10.4.4 A NWM for Time-fluctuating Quantities 270
10.4.5 A NWM for Reattachment and Separation Points 271
10.5 Conclusions 272

Part V Numerical Tests

11 Variational Approximation of LES Models 275
11.1 Introduction 275
11.2 LES Models and their Variational Approximation 276
11.2.1 Variational Formulation 277
11.3 Examples of Variational Methods 281
11.3.1 Spectral Methods 281
11.3.2 Finite Element Methods 282
11.3.3 Spectral Element Methods 282
11.4 Numerical Analysis of Variational Approximations 282
11.5 Introduction to Variational Multiscale Methods (VMM) 285
11.6 Eddy Viscosity Acting on Fluctuations as a VMM 289
11.7 Conclusions 293

12 Test Problems for LES 295
12.1 General Comments 295
12.2 Turbulent Channel Flows 296
12.2.1 Computational Setting 297
12.2.2 Definition of Re_τ 298
12.2.3 Initial Conditions 300
12.2.4 Statistics 301
12.2.5 LES Models Tested 303
12.2.6 Numerical Method and Numerical Setting 305
12.2.7 *A Posteriori* Tests for $Re_\tau = 180$ 307
12.2.8 *A Posteriori* Tests for $Re_\tau = 395$ 310
12.2.9 Backscatter in the Rational LES Model 312
12.2.10 Numerical Results 315
12.2.11 Summary of Results 318

12.3 A Few Remarks on Isotropic Homogeneous Turbulence 320
12.3.1 Computational Setting 321
12.3.2 Initial Conditions 322
12.3.3 Experimental Results 323
12.3.4 Computational Cost 323
12.3.5 LES of the Comte-Bellot Corrsin Experiment 324
12.4 Final Remarks 324
