Contents

1 Introduction 1

Part I Short Primer on Basic Averaging and Modeling Approaches for Turbulent Mixing Instabilities

2 Single-Fluid Approach: Example of Dam's k–ε Model 7
2.1 Single-Fluid Statistical Equations 7
2.2 An Elementary Single-Fluid Closure: The Incompressible k–ε Model 11
2.3 An Extension to Variable Densities: Dam's k–ε Model 13

3 Two-Fluid Approach: Example of Awe's Model 17
3.1 Two-Fluid Statistical Equations 17
3.2 An Elementary Two-Fluid Closure: Awe's Model 23

Summary of Part I 29

Part II "0D" Reduction of Experiments and Models in Mixing Instabilities

4 Mixing Instabilities in Developed Regime: Phenomenology of Energy Balances 33
4.1 Review of Different Instability Types and Regimes 33
4.2 "0D" Energy Balance in Self-Similar, Incompressible, Developed Regime at Zero Atwood Number 34
4.3 "0D" Turbulent Energy and Structure in Self-Similar, Incompressible, Developed Regime at Zero Atwood Number . . 37

4.4 "0D" Reduction of Evolution Equations of Hydrodynamic Models . . . 43

5 Reconstruction by Dam's k–ε Model of Developed Mixing Instabilities . . . 47
5.1 Comments on the "Richtmyer–Meshkov" Calibration of Coefficients $C_{\varepsilon 0}$ and σ_ϱ . . . 47
5.2 "0D" Reconstruction by Dam's k–ε Model of Basic Self-Similar Instabilities . . . 49
5.2.1 General Remarks, Reconstruction of the Directed Kinetic Energy . . . 49
5.2.2 Construction and Resolution of the "0D" Differential System . . . 49
5.2.3 Realizability of Turbulent Closures . . . 54
5.2.4 Estimation of Errors Introduced by the "0D" Approach . 54
5.3 "0D Rayleigh–Taylor" Calibration of Coefficients $C_{\varepsilon 0}$ and σ_ϱ . . 55
5.3.1 Discussion of the "0D" Results . . . 55
5.3.2 Stability and the RT Case with Self-Similar Variable Acceleration . . . 56
5.3.3 Conclusions on Dam's k–ε Model . . . 60

6 Awe's Two-Fluid Model of Developed Mixing Instabilities . 63
6.1 "0D" Reconstruction by Awe's Two-Fluid Model of Basic Self-Similar Instabilities . . . 63
6.1.1 General Remarks, Drag Characteristic Length Scale . . . 63
6.1.2 Rayleigh–Taylor and Richtmyer–Meshkov Cases . . . 64
6.1.3 Kelvin–Helmholtz Case . . . 66
6.2 Calibration of Coefficients C_i and C_d of Awe's Two-Fluid Model . . . 70
6.2.1 Effect of the Coefficients on KH, RT, and RM Instabilities . . . 70
6.2.2 Stability and the RT Case with Self-Similar Variable Acceleration . . . 71

Summary of Part II . . . 75

Part III Comparative Assessment of Models, New Development Approaches

7 Comparison of Single- and Two-Fluid Approaches . . . 79
7.1 Summary of "0D" Reconstructions of the Three Instabilities by the Single- and Two-Fluid Models . . . 79
7.2 About the "Rayleigh–Taylor" Source Term in Single-FluidModels . . . 81

7.3 Two-fluid Realizability of Single-Fluid Closures of Turbulent Fluxes 84
7.4 The "Two-Fluid Extended" Single-Fluid Approach 86

8 Specific Treatment of Shocks: Constraints on Models 93
8.1 Qualitative Phenomenology of Interaction Between a Shock and Velocity or Density Heterogeneities 93
8.2 Preliminary Comments on Modeling of Shock–Heterogeneity Interaction 96
8.3 On Artificial Dissipation in a Two-Fluid Medium 99
8.4 Basic Bias Estimates of Dam's k–ε and Awe's Two-Fluid Models Applied to Shock–Turbulence Interaction 102

9 Some Perspectives on Further Developments of Models ... 107
9.1 About Second-Order Extensions of Single-Fluid Turbulent Mixing Models 107
9.2 Molecular Interdiffusion, Demixing, and Separation of Geometric and Turbulent Scales 109
9.2.1 Interdiffusion 109
9.2.2 Geometric and Turbulent Scales 112
9.3 Ⓤ Self-Similar Variable Acceleration Rayleigh–Taylor Flows (SSVARTs) 113
9.3.1 Extension of SSVARTs to $n < -2$ 113
9.3.2 Spectral Quasi-Equilibrium and Relevance of Models in SSVARTs 115

Summary of Part III 119

10 Conclusion, Future Modeling Trends 121

A Notations and Acronyms 125

B Modeling of Noise Term 129

C Correction of the Input Energy, K_I, of the Kelvin–Helmholtz Instability 131

D Turbulent Flux of k Expressed in Two-Fluid Terms 133

E About the Effects of Compressibility on Closures of Turbulent Fluxes 135
