Preface	VII
Contents	XII
Nomenclature	XIII
1 Micro Process Engineering – An Interdisciplinary Approach	1
1.1 Introduction and Motivation	1
1.2 Orientation of Micro Process Engineering	2
1.3 The Role of Transport Processes	3
1.4 Main Issues of Successful Microstructures	9
1.4.1 Wall heat conductivity	10
1.4.2 Pressure loss	10
1.4.3 Corrosion, fouling, and catalyst deactivation	12
1.5 Scaling dimensions and issues	13
1.5.1 Material properties	13
1.5.2 Processes	16
1.5.3 Devices	25
1.6 Actual Applications and Activities	30
1.6.1 European activities	30
1.6.2 Activities in the US	33
1.6.3 Activities in the Far East	34
1.7 Barriers and Challenges	38
2 Fundamentals, Balances, and Transport Processes	41
2.1 Introduction	41
2.2 Unit Operations and Process Design	43
2.2.1 Process simulation, scale-up, and equal-up	43
2.2.2 Method of process, equipment, and plant design	45
2.2.3 Design principles for process equipment	50
2.3 Balances and Transport Equations	52
2.3.1 Statistical mechanics and mean free path	52
2.3.2 The Boltzmann equation and balance equations	58

2.3.3	Macroscopic balance equations	61
2.3.4	Elementary transport processes and their description	65
2.3.5	Molecular velocities and macroscopic fluid properties	68
2.3.6	Limits of linear transport properties	71
2.4	Modeling, Calculation Methods, and Simulation	73
2.4.1	Physical variables and dimensional analysis	73
2.4.2	Similarity laws and scaling laws	74
2.4.3	Order-of-magnitude analysis	75
2.4.4	Lumped element modeling	76
2.4.5	Numerical simulation and analytical modeling	77
2.5	Future Directions of Micro Process Engineering Research	78
3	Momentum Transfer	81
3.1	Momentum Transport of Single-Phase Flow	81
3.1.1	The momentum equation and force balance	81
3.1.2	The energy equation for fluid dynamics	83
3.1.3	Basic equations for long, small channels	85
3.1.4	Compressible flow	89
3.1.5	Viscous heating and entropy generation in channel flow	92
3.1.6	Fluid dynamic entrance length	96
3.2	Convective Fluid Dynamics in Microchannels	97
3.2.1	Dean flow in 90° curves	98
3.2.2	Fluid forces in bends	100
3.2.3	Fluid dynamics in T-junctions with symmetric inlet conditions	102
3.2.4	Flow regimes in T-shaped micromixers	107
3.3	Multiphase Flow	119
3.3.1	Gas-liquid flow patterns	120
3.3.2	Two-phase pressure loss	122
3.3.3	Contacting and phase separation	123
3.3.4	Immiscible liquids	125
4	Heat Transfer and Micro Heat Exchangers	129
4.1	Heat Transfer Fundamentals	129
4.1.1	The energy balance	129
4.1.2	Heat conduction in small systems	131
4.1.3	Convective heat transfer in microchannels	134
4.1.4	Rarefied gases with slip boundary conditions	136
4.1.5	Convective cooling for flow measurement	139
4.2	Microfluidic Networks for Heat Exchange	143
4.2.1	Status-quo of microfluidic networks for device cooling	144
4.2.2	Single channel element calculation	145
4.2.3	Combined channel elements	148
4.2.4	Heat exchanger channel network	149
4.3	Micro Heat Exchanger Devices	152
4.3.1	Number-of-thermal-units (NTU) concept	154

4.3.2	Design issues for exchange equipment	156
4.3.3	Fouling and blocking of equipment	159
4.3.4	Particle deposition in microchannels	161
5	Diffusion, Mixing, and Mass Transfer Equipment	163
5.1	Mixing Processes and Their Characterization	163
5.1.1	Mixing principles and description	164
5.1.2	Mixing characterization	166
5.1.3	Potential of diffusive mixing	168
5.1.4	Stoichiometric mixing and diffusion process	169
5.2	Diffusive Mass Transport and Concentration Distribution in Fluids ..	172
5.3	Convective Mass Transport	174
5.3.1	Analogy between heat and mass transfer	174
5.3.2	Mixing time scales and chemical reactions	175
5.4	Characteristics of Convective Micromixers	182
5.4.1	Mixing behavior in 90°bends	183
5.4.2	Mixing behavior of T-shaped micromixers	185
5.4.3	T-shaped micromixers and combinations	190
5.4.4	Mixing times of convective micromixers	193
5.4.5	Energy dissipation into mixing	196
5.4.6	Mixing effectiveness	198
5.4.7	Summary of Convective Micromixers	202
5.5	Mixing and Chaotic Advection	203
5.5.1	Concept of chaotic advection	203
5.5.2	Geometry and flow regimes	205
5.5.3	Fluid lamellae and chemical reactions	207
5.6	Design and Fabrication of Silicon Micromixers	209
5.6.1	Microstructured mixers for liquid phase precipitation	211
5.6.2	Microstructured mixers for aerosol generation	212
5.6.3	Microstructured mixers with two wafers	214
5.7	High Throughput Mixing Devices with Microchannels	215
5.7.1	Numerical simulation of mixing elements	218
5.7.2	Experimental results and discussion	220
5.7.3	Performance investigation	223
5.7.4	Injection micromixers	224
6	Chemical Reactions and Reactive Precipitation	225
6.1	Chemical Reactor Engineering	225
6.1.1	Heat and mass transfer with chemical reactions	228
6.1.2	Characteristics of continuous flow reactors	229
6.1.3	Temperature control in microchannel reactors	233
6.2	Wall Mass Transfer and Surface Reactions in Microfluidic Systems	236
6.2.1	Continuum transport model	237
6.2.2	Physical meaning of dimensionless parameters	240
6.2.3	Graetz problem and wall mass transfer	240

6.2.4	Wall mass transfer in microchannel reactors	242
6.2.5	Wall adsorption and saturation time scales	244
6.3	Design Criteria for Microchannel Reactors	248
6.3.1	Equipment design process	248
6.3.2	Reaction kinetics and transport processes	251
6.3.3	Heterogeneous catalytic reactions in microchannel reactors	253
6.3.4	Scale-up and economic situation	255
6.3.5	Scale-up method with equal-up principle	258
6.3.6	Iodide-iodate reaction for selectivity engineering	261
6.3.7	Competitive-consecutive reactions	264
6.4	Microreactors for Aerosol Generation	267
6.4.1	Nanoparticle generation	267
6.4.2	Asymmetrical mixing in microchannels	268
6.4.3	Experimental characterization of mixing regimes	272
6.4.4	Aerosol generation by homogeneous condensation	272
6.5	Mixing and Defined Precipitation in Liquid Phase	275
6.5.1	Modeling and simulation of particle precipitation	277
6.5.2	The population balance equation	278
6.5.3	Precipitation in the interdiffusion zone	280
6.5.4	Binary compound precipitation in convective micromixers	282
6.5.5	Experimental investigations of barium sulfate precipitation	286
6.5.6	Experimental investigation of pigment synthesis	290
7	Coupled Transport Processes	293
7.1	Thermodynamics of Irreversible Processes	294
7.2	Thermoelectric Energy Conversion	297
7.2.1	Microscale thermoelectric energy conversion	299
7.2.2	Design and fabrication of the generator	301
7.2.3	Experimental characterization and discussion	306
7.2.4	Thermocouples and microfluidic chips	308
7.3	Electro-osmotic and Electro-kinetic Effects	311
7.4	Thermodiffusion	312
7.4.1	Design and fabrication of thermodiffusion devices	312
7.4.2	Experimental investigations with thermodiffusion chips	315
7.4.3	Improvement of thermodiffusion devices	317
7.4.4	Knudsen pump	318
7.5	Pressure Diffusion	319
8	Conclusion and Final Remarks	321
